Secure Your Cloud Applications

Cloud applications like Google G Suite and Microsoft Office 365 are powerful tools with collaborative capabilities for companies of all sizes. At ManagedMethods, we have built a simple, yet effective security tool that compliments the native security features in cloud applications at an affordable price.

Additional Layer of Security and Visibility

Many IT leaders mistakenly believe that their cloud data is sufficiently secured with cloud applications' native security features. In truth, if you are solely relying on native cloud app security, your company's data is likely vulnerable to data breaches, both unintentional and malicious.
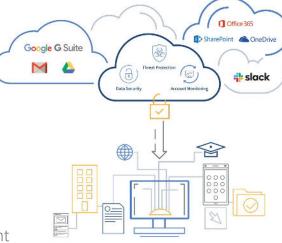

ManagedMethods uses a blend of security partnerships and proprietary technology to provide cloud app users with an additional layer of security that gives IT leaders and managers peace of mind. The platform also provides visibility and control to account activity, 3rd party application usage, and content sharing within the corporate environment.

Securing Your Cloud Environment

Data security shouldn't stop and start at your gateway. ManagedMethods is the only cloud application security solution that secures your file sharing, email, and 3rd party applications all in one easy-to-use platform. We'll let you know what is going on within your cloud applications, as well as what it coming in and going out.

Gain visibility into email spoofing and malware attacks and prevent data loss in shared and team drives. Using templated or customized policies, you can be assured that your sensitive data is properly secured while you're busy putting out fires elsewhere.

Save Time Running Reports and Auditing

ManagedMethods makes auditing your cloud environment, running security reports, and understanding trends easier and less time-consuming. Our reporting features work across your cloud environment, including cloud applications such as G Suite, Office 365, Slack, Box, and Dropbox. With ManagedMethods, auditing your cloud environment happens all within one easy-to-use platform.
